

TABLE OF CONTENTS

SECTION	SECTION TITLE	CONTENTS DESCRIPTION
	<i>Logsheet</i>	Listing of contents of each page of standards with click-on access to each page
	<i>Introduction</i>	Copyright Notice, Foreword, Metrication and Standardization Background, Preface and Request for Change (form).
GEN	<i>General Information</i>	Reference Publications, Contacts for Standards, Metric Equivalent Charts, Selected Rules for Communicating in the SI Metric System, Surface Roughness Conversion, Tolerance Information, Component Identification, Page Formatting, Logsheet
A	<i>Air Cylinders</i>	Air Cylinders, Mounting Brackets & Accessories
C	<i>Aerial Cam Specs</i>	Cam Envelope, Cam Performance Calculation, Dimensions and Performance Charts
D	<i>Stamping Dies Cast Materials</i>	Gray Cast Iron, Ductile Iron, Non-Alloyed and Alloyed Steel, and Tool Steel
F	<i>Fasteners</i>	Standard Socket Head Cap Screws, Low Profile Socket Head Cap Screws, Socket Flathead Cap Screws, Socket Head Shoulder Screws, Hex Head Bolts, Socket Set Screws, Hex Nuts, Hex Jam Nuts, Plain Washers, Hardened Washers, Pull Dowels, Lock Washers
G	<i>Guide & Gage Components</i>	Guide Blocks, U & V-Blocks, Center Guides & Keys, Guide Pins, Guide Pin Bushings, Pad Bushings, Bushing Toe Clamps, Disappearing Gages
L	<i>Lift Components</i>	Reusable Lift Pins, Lift Pin Liners
M	<i>Miscellaneous</i>	Tooling Ball, Scrap Chute Bracketry
N	<i>Nitrogen Cylinders</i>	Nitrogen Cylinders, Hose Fittings, O-Ring Face Fittings, Control Panel
P	<i>Punches & Buttons</i>	Punches, Retainers, Urethane Punch Strippers, Punch Stripper Retainers & Backing Plates, Standard Punches, Ejector Punches, Pilots, Die Buttons (Standard & Tapered Relief)
R	<i>Retaining Components</i>	Keeper Blocks, Cam Gibs, Gib Plates, Spool Retainers, Pad Retaining Pins, Pad Standby/ Lock-up Pins
S	<i>Springs & Accessories</i>	Wire Springs, Spring Cages, Fiber Belted Rubber Springs
W	<i>Wear Components</i>	Standard Wear Plates, Cam Dwell Wear Plates, Wear Strips

Information contained in this NAAMS material, e.g., pictorial descriptions, notes and specifications, NAAMS tables, codes and dimensions, may be cited, referenced or reproduced solely for the purpose of describing a physical component, or the application of a physical component, described in these NAAMS standards.

The AUTO/STEEL PARTNERSHIP specifically prohibits reproducing or copying, in whole or part, the mark *NAAMS and associated design* in any form.

WARNING

The copyright law of the United States governs the making of photocopies or other reproductions of copyrighted material. One of these specified conditions is that the photocopy or other reproduction is not to be used for any purpose other than private study, scholarship or research. If the user reproduces NAAMS material in excess of "fair use," that user may be liable for copyright infringement.

The use of information contained in this NAAMS material is not warranted to be applicable or suitable for any particular purpose. Any liability, including infringement of trademarks, copyrights or patents, arising from the use of these materials is the sole responsibility of the user.

DISCLAIMER

These standards are for general information only. The drawings are not intended for use as detailed manufacturing drawings. The drawings represent only envelope size, configuration and mounting method, as applicable, and general characteristics of the item depicted. Complete and detailed manufacturing drawings are the sole responsibility of the manufacturer intending to produce items as described in this publication.

The publication of the information is not intended for use as a representation or warranty on the part of the Auto/Steel Partnership, including any entity or person named herein that the information is suitable for any general or particular use, and it does not imply freedom from infringement of any patents or trademarks. Anyone making use of the information assumes all liability arising from such use.

These standards are subject to periodic review and may be revised on a page-by-page basis. Users are cautioned to refer to the latest revision.

The Auto/Steel Partnership (A/SP) is a North American industrial innovation. Formed in 1987, it is a unique international consortium and the first to include Chrysler LLC, Ford, General Motors and their suppliers. Although the principal Partnership role is sponsoring and directing applied research and validation, followed by communication of the results and conclusions, the most important role may be that of the forum for discussing matters of mutual interest and concern to the automotive, steel and related industries. This open communication channel fosters improved understanding, cooperation and resource leveraging that benefits all participants and optimizes automotive body designs, processes and tooling.

The Auto/Steel Partnership members are:

AK Steel Corporation	ArcelorMittal
Chrysler LLC	Newcore Corporation
ArcelorMittal Dofasco	Severstal North America, Inc.
Ford Motor Company	United States Steel Corporation
General Motors Corporation	

In addition to the NAAMS Stamping standardization and the Assembly standardization projects, the Auto/ Steel Partnership sponsors efforts in other areas, such as:

- Design manuals for mild steels, high strength steels, manufacturability, tailored blanks, etc.
- Production sheet steel mechanical property, surface texture and coating weight studies
- Stamping and assembly tooling cost and lead time optimization
- Dimensional management and process control options for the automotive body-in-white
- Development of standardized permanent deformation, resistance welding and corrosion tests
- Research projects to optimize resistance welding electrode wear and stamping lubricants.

The Partnership is continually evaluating other endeavors that may offer strategic opportunities for future advancement. Several examples are:

1. Increased utilization of various national and international applied research activities
2. Alternate joining technology assessment
3. Potential benefits of a center of expertise for metal fabrication coupled with improved technical training and education.

METRICATION AND STANDARDIZATION BACKGROUND

The potential benefits for commonized or standardized tooling within the auto industry have been recognized for several decades; however, progress had been virtually nil. At the December, 1991 annual meeting of the Michigan Tooling Association (MTA), the MTA members proposed to the automotive representatives from Chrysler LLC, Ford, and General Motors in attendance that the auto industry consider the challenge of commonization or standardization one more time. The intent of this type of endeavor would be to:

- Reduce overall stamping and assembly tooling cost
- Provide standardized metric convention for tooling
- Provide standardized metric componentry for tooling
- Reduce the variety of functionally similar items.

The automotive representatives suggested that the Auto/Steel Partnership (A/SP) could provide an appropriate avenue for pursuing this activity since the A/SP has an excellent success rate for efforts and projects of this nature. Subsequent to the MTA meeting, the A/SP and the Industrial Development Division of the University of Michigan hosted an “ad hoc” group of representatives from the three automotive companies and the Michigan Tooling Association in January, 1992 to determine if they felt further standardization discussions could lead to a mutually satisfactory end point. The participants in this initial meeting did conclude that:

1. A mutually satisfactory end point could be reached
2. The Auto/Steel Partnership could provide the appropriate avenue for this effort. In February, 1992 the A/SP Joint Policy Board agreed to sponsor and fund commonization/standardization activities related to automotive stamping and assembly tooling.

After several meetings with the tooling and automotive communities, singularly and collectively, these communities agreed to form the Stamping Tooling Standardization Group (STSG) in May, 1992 to address potential development and adoption of common stamping tooling standards. A similar group, the Assembly Tooling Standardization Group was also formed at the same time to address potential development and adoption of common assembly tooling standards.

The NAAMS Global Standard Components Team, which was originally chartered as the North American Automotive Metric Standards Project Team (NAAMS) is one of several Project Teams organized within the Stamping Tooling Standardization Group. The result of the NAAMS effort is a compendium of recommended automotive tooling practices related to metric convention as well as several thousand standardized hard metric components. Chrysler LLC, Ford Motor Company and General Motors Corporation have adopted a substantial portion of these standards for use in stamping die design, specification and construction.

The Auto/Steel Partnership recognizes that the true NAAMS success belongs to the representatives of the supplier and automotive companies who dedicated significant time and effort to this activity. They have participated in numerous meetings (average five to seven hours per meeting) since 1992. Each meeting was attended by:

- Three to five consistent Chrysler LLC, Ford and General Motors representatives
- Five consistent tooling company representatives
- Varying numbers of suppliers representing specific topical areas.

PREFACE

GLOBAL STANDARD COMPONENTS

Stamping

12/17/07

This set of standards is a companion to the NAAMS Global Standard Components – Assembly. The products described herein are applicable to, or components of, steel stamping tools designed and built for the North American automotive companies, i.e., Chrysler LLC, Ford Motor Company and General Motors Corporation and their supplier/support companies. The standards have been developed to establish metric measurements for envelope dimensions and operational characteristics for the various components specified for stamping tools used by the North American automotive companies.

The NAAMS Global Standard Components Project Team was responsible for determining the dimensions and characteristics for each component and organizing the standards in their final form. The only exception is Section F, Fasteners, which was developed jointly with the NAAMS Assembly Teams. Items within this standard reflect a balanced representation of the various manufacturers and users of the products. All agreements and concessions made by the individual participants were for the general good of the standardization process.

Approval and control for these standards, and authority to add, delete, modify, etc., rests with the Auto/Steel Partnership. All communication related to the NAAMS Project Team, or standards, should be made through the NAAMS Administrator, telephone (248) 945-4779, fax (248) 356-8511, or e-mail gene@a-sp.org.

Roger A. Heimbuch
Executive Director
Auto/Steel Partnership

REQUEST FOR CHANGE

This form is provided for the convenience of those who wish to request changes, additions or deletions to those standards. Please use this page as a duplication master and submit one request for each change.
